SUMMARY

Senior frontend engineer and team lead, 7 years building web applications and strong JavaScript, 5 of them commercial React and TypeScript, 3 of them leading a team of four while writing code every week. I was part of the launch team that took a three-application Next.js monorepo from an empty repository to production and first revenue, and I wrote the standards, module contracts and ADRs that codebase still runs on after I left. Node.js and NestJS over PostgreSQL on the backend, REST APIs I designed rather than inherited, CI/CD and production operations end to end, and the front line for incidents on a live marketplace. My first two years were production layout work before React, which is why UI quality and accessibility are habits rather than requirements. I also built my last team's AI-assisted development workflow by hand, configured the agents and MCP servers it runs on, and taught four engineers to work in it.

WORK EXPERIENCE

Senior Next.js Developer | Front-end Team Lead **Oct 2024 - Sep 2026**

Aventus Group - GGChest, gaming marketplace (customer-facing eCommerce) · Poland · Remote

- Worked on the architecture of all three applications of a gaming marketplace used by thousands of people - the client storefront, the seller panel and the internal admin console - in one Next.js App Router + TypeScript monorepo on Turborepo with pnpm workspaces, built on Feature-Sliced Design. I was part of the launch team that took it from an empty repository to production and through to first revenue, then stayed for support and ongoing development.
- Built the product's payment experience on the frontend: Google Pay, Apple Pay and card payments through Primer as the orchestration layer, plus the third-party applications wired in around it. The server-side pieces - webhooks, reconciliation, the ledger - were not mine.
- Designed and built the notification system: our own long-polling layer, a server-side cache and third-party SSE underneath it.
- Led a frontend team of 4 and onboarded 9 engineers. I wrote the standards and protocols the application runs on - conventions, module contracts, ADRs - still the team's reference after my departure, and reworked how the team worked day to day.
- Built the product's design system single-handedly across all three applications - Ant Design in one, Shadcn/ui with Tailwind CSS in the others: tokens, variants, interaction states, Storybook. I did the design work too, against competitor analysis and the business strategy, with requirements that kept moving - then Figma to pixel-perfect UI including the parts usually dropped: empty, loading and error states, focus and keyboard behaviour, responsive breakpoints down to small phones.
- Took the build pipeline from ~15 minutes to under 1 minute on a growing codebase, and the work was architectural as much as configuration: removed the circular dependencies, put real module boundaries in place so they could not come back, moved the project onto React Server Components, and migrated the monorepo from Nx to Turborepo - having shipped both, I can say where each earns its keep.
- Bundling, delivery and DX: bundle analysis, tree shaking, custom bundler setups, code splitting, size budgets, static asset optimisation and caching, the routine static-asset work automated, internal utilities and libraries for the team, cross-platform toolchain support - and the whole release cycle.
- Built the team's AI-assisted development workflow by hand - skills, rules, hooks, agent instruction files. Spec first, implementation and tests generated against it, a second agent pass verifying the diff, CI gates holding agent code to the same bar. ~70% more tasks per sprint, review load unchanged.
- State and data: TanStack Query everywhere for server state - deliberate query keys and cache invalidation - over an axios layer, Zustand for UI state, and TanStack Start with TanStack Router in a separate application from the Next.js one.
- Front line for production emergencies: I took the urgent problems on the live marketplace - triage, diagnosis, fix - along with the bugs customers reported.
- Testing and measurement: Jest, Vitest, React Testing Library, Playwright, MSW, Zod at the boundary, gated in CI on every PR, plus regression testing. Analysed real user flows and loading metrics; Sentry and real-user Core Web Vitals alongside.
- Worked past my own area in both directions: raised what was broken across the whole product, not only the frontend I owned, and sat in the business decisions - shaping product strategy, simplifying user flows, proposing approaches drawn from what competitors were shipping.

Senior React Developer **Jul 2024 - Jan 2025**

AppLikeWeb · project within Aventus Group · Warsaw, Poland

- Small team, working closely with the Flutter developer: I built the web preview layer that rendered the Flutter app inside the web product, and designed the Flutter-to-React-host communication protocol.
- Owned the architecture of the React applications here end to end - structure, module boundaries, state and data flow - plus their runtime performance, and did the design and UI/UX requirements analysis before building the result: complex interfaces and forms in React, TypeScript and Material UI. Mentoring too.
- Wrote my own libraries rather than working around the friction: one for the complex-form problem, and developer-experience tooling for the team.
- Touched the Python backend where features needed it - FastAPI endpoints and the data behind them.

React Developer **May 2024 - Dec 2024**

Crowdpear | PeerBerry · project within Aventus Group · Poland

- Frontend for two fintech platforms: PeerBerry, an alternative-investment platform, and Crowdpear, a real-estate crowdfunding platform. I built new financial features on both, not only maintained them.

- Modernised a legacy codebase: migrated old code onto current libraries and framework versions, kept the product working through it on Material UI, Ant Design and React Admin, and improved the typing as I went.
- Fixed business-logic bugs in investor-facing flows - the kind where the UI is fine and the rule behind it is wrong, so you have to read the domain before you touch the code.

Front-end Engineer | Team Lead **Mar 2023 - May 2024**

Nova Developers Co · Self-employed · Remote

- Led and mentored up to 4 project teams of 3-6 engineers in parallel while staying hands-on in the code, and owned how the work was organised and tracked.
- Worked directly with the clients: scoped the projects, analysed delivery risk, allocated budgets across them, and did the design work myself on several.
- Built CRM systems, admin panels and marketing sites in React and Next.js, from architecture to release.
- Built a full Google Calendar equivalent from scratch for an internal staff-training platform - by hand, not on top of a calendar library: views, scheduling and recurrence all written from zero.
- Wrote the business processes, workflows and internal documentation the teams ran on, and ran the knowledge sharing across them. Moved into the backend here too, learning it on live projects: NestJS, Express and Python.

Fullstack Developer | Designer **Oct 2019 - Mar 2023**

Freelance · Self-employed · Remote

- Shipped client products end to end, often as the only engineer: responsive, cross-browser, accessible, SEO-correct interfaces from Figma and PSD, pixel accuracy as the paid deliverable.
- Did the design as well as the build on many of them, which is where the eye for UI detail comes from.
- From 2021, commercial React applications; on fullstack projects owned the API layer - Django on some clients, NestJS and Express on others - plus the SQL schema behind them.
- On content-driven client projects ran Strapi as the headless CMS end to end: stood the instance up from scratch, modelled the content types and relations, set roles and permissions, then built the frontend against its API.

PROJECTS

Bitrate - open-source platform for musicians · github.com/Lordpluha/bitrate

- My own project on a deliberately wide stack. Backend: Node.js, NestJS, Express, PostgreSQL with Prisma, REST with OpenAPI-generated contracts, JWT, OAuth, Cloudflare Zero Trust, ffmpeg for audio; real-time four ways - WebSocket, SSE, long polling and short polling.
- Frontend and delivery: React, Next.js, Angular, Svelte, a PWA with a Service Worker caching API responses, Vite, a custom SVGR processing library I wrote, Tauri and React Native targets; Turborepo with pnpm workspaces, Changesets, Taskfile, Docker Compose, Nginx, GitHub Actions, Playwright, Vitest, Grafana, Prometheus, Docusaurus.

TECHNICAL SKILLS

Core: JavaScript (ES2023), TypeScript (strict), HTML5, CSS3, React 18/19, Next.js (App Router, SSR/SSG/ISR, React Server Components), TanStack Start
State, data, routing & forms: TanStack Query, TanStack Router, Zustand, axios, Redux Toolkit, RTK Query, React Context, Nuqs, React Hook Form, Zod
UI: Ant Design, Material UI (MUI), React Admin, Shadcn/ui, Tailwind CSS, SCSS/Sass, CSS Modules, Styled-components, Storybook, Design Systems, Figma, Pencil
Build, bundling & delivery: Turborepo, Nx, pnpm / npm / Yarn workspaces, Vite, Webpack, Babel, bundle analysis, tree shaking, custom bundler configuration, code splitting, bundle-size budgets, static asset optimisation, caching
Infrastructure & operations: Docker and Docker Compose, Nginx with TLS and reverse proxy on a self-managed VPS, GitHub Actions CI/CD pipelines, Cloudflare Zero Trust, Grafana, Prometheus, Sentry, release and versioning process, production incident triage and diagnosis
Testing & observability: Jest, Playwright, Vitest, React Testing Library, MSW, regression testing, Sentry
UI quality & web platform: pixel-perfect implementation, accessibility (WCAG, ARIA, semantic HTML), cross-browser, responsive design, i18n, SEO, Core Web Vitals, Lighthouse, React render profiling, PWA, Service Workers
AI development tools: Claude Code daily on production code, third-party MCP servers (integration and configuration), agent instruction files, skills, rules and hooks authored by hand, subagents, tool permissions, parallel agent sessions, GitHub Copilot, Codex
Architecture: Feature-Sliced Design, Micro-frontends, Clean Architecture, module boundaries, Feature Flags
Payments & real-time: Primer (payment orchestration), Google Pay, Apple Pay, card payments, notification systems, long polling, Server-Sent Events (SSE), server-side caching, third-party API integrations
Backend & data: Node.js, NestJS, Express, REST API design, GraphQL, WebSocket, Prisma, TypeORM, PostgreSQL, MySQL, SQL, Python (Django, FastAPI), Strapi (headless CMS)
Leadership & DX: team leadership, mentoring, onboarding, code review, ADRs, coding standards, developer experience, internal tooling, release and versioning process, Agile / Scrum, Jira, remote distributed teams
ALSO - side projects and coursework, not production: Angular, Svelte, SvelteKit, Tauri, React Native, **Three.js, WebGL, Canvas, Bun, Framer Motion · currently expanding:** Flutter, Electron

EDUCATION & LANGUAGES

Bachelor of Modern Web Programming and Game Development - NTU "Kharkiv Polytechnic Institute", 2023 - 2027
CyberSecurity - KRAUSS College, 2021 - 2023 · Languages: English C1 · Polish B2-C1 · Ukrainian and Russian native
